

## **innoelectric AG - Company profile**

innoelectric develops and produces components for electric mobility. Power electronics and charging communication are the key areas of our product portfolio.

We recognized early on that new, smart solutions are needed to turn electromobility from a good idea into an easy-to-use and efficient alternative on the road and beyond. innoelectric was established in 2016 as a spin-off from a company that is a leader in the field of automotive test systems for electric drives. Thus, innoelectric combines the dynamics of a young company with the competence of an experienced player in electric mobility.

In addition to innovative products that rely on sustainable and clean energy for future mobility, innoelectric also considers social responsibility towards its employees to be of great importance. The location in the heart of the Ruhr area enables not only a close competence network but also intensive cooperation with colleges and universities and therefore the employees of tomorrow.

Teamwork, a deep understanding of electromobility and personal enthusiasm in the entire team are the basis on which we drive our projects forward. Our goal is to create efficient products that meet the requirements of our customers. Because we understand how sustainable mobility works and find clever solutions for the mobility of tomorrow.
